

ABSTRACT OF THE DISCLOSURE

The coat includes a body, sleeves and a collar. The liner system includes a thermal barrier and a moisture barrier. The upper portion of the thermal barrier is detachably connected to the inner part of the collar of the coat, while the upper portion of the moisture barrier is detachably connected to the outer part of the collar. The upper portions of the thermal barrier and moisture barrier are free of one another; and the upper portion of the moisture barrier extends into the collar a substantial distance above the upper edge portion of the thermal barrier when the collar is in vertical position. The lower portions of the thermal barrier and the moisture barrier are stitched to one another along a part of the lower portions thereof such that they can be readily disconnected from one another.. The lower portions of the barriers are detachably connected to one another at spaced points along another part of the lower portions thereof.. The lower portions of the barriers are free of the body of the coat. The side portions of the two barriers are detachably connected to one another at spaced points along the length thereof; and the side portions of the thermal barrier are detachably connected to the body.
